	Background: Adapter protein that binds F-actin and DNM1, and thereby plays a role in receptor-
	mediated endocytosis. Plays a role in the reorganization of the actin cytoskeleton, formation of
	cell projections, such as neurites, in neuron morphogenesis and synapse formation via its
	interaction with WASL and COBL. Does not bind G-actin and promote actin polymerization by
	itself. Required for the formation of organized podosome rosettes (By similarity). May act as a
	common effector of antigen receptor-signaling pathways in leukocytes. Acts as a key
	component of the immunological synapse that regulates T-cell activation by bridging TCRs and
	the actin cytoskeleton to gene activation and endocytic processes.
