	Background: eRF3a is a 499 amino acid protein that belongs to the GTP-binding elongation	
	factor family and is involved in the regulation of cell growth, specifically via control of	
	translation termination. Human eRF3a shares 94 % sequence identity with its mouse	
	counterpart, suggesting a conserved function between species. The gene encoding eRF3a	
	maps to human chromosome 16, which encodes over 900 genes and comprises nearly 3 % of	
	the human genome. The GAN gene is located on chromosome 16 and, with mutation, may lead	
	to giant axonal neuropathy, a nervous system disorder characterized by increasing malfunction	
	with growth. The rare disorder Rubinstein-Taybi syndrome is also associated with chromosome	
	16, as is Crohn's disease, which is a gastrointestinal inflammatory condition.
