Target Details

Background:	Synonyms: Dickkopf receptor 2, KREM2_HUMAN, KREMEN 2, Kremen protein 2, Kremen protein 2 precursor, Kremen2, Kringle containing protein marking the eye and the nose, Kringle containing transmembrane protein 2, Kringle domain containing transmembrane protein 2, Kringle domain-containing transmembrane protein 2, Kringle-containing protein marking the eye and the nose, KRM 2, KRM2, MGC10791, MGC16709. Background: This gene encodes a high-affinity dickkopf homolog 1 (DKK1) transmembrane receptor. A similar protein in mouse functions interacts with with DKK1 to block wntless (WNT)/beta-catenin signaling. The encoded protein forms a ternary membrane complex with DKK1 and the WNT receptor lipoprotein receptor-related protein 6 (LRP6), and induces rapid endocytosis and removal of LRP6 from the plasma membrane. It contains extracellular kringle, WSC, and CUB domains. Alternatively spliced transcript variants encoding distinct isoforms have been observed for this gene. [provided by RefSeq, Dec 2011]
