Target Details

Background:	<p>Synonyms: Heterogeneous nuclear ribonucleoprotein G-like 1, N-terminally processed, RBM1, RBMXL1, RMXL1_HUMAN, RNA binding motif protein, RNA binding motif protein X linked like 1, X-linked-like-1.</p> <p>Background: This gene represents a retrogene of RNA binding motif protein, X-linked (RBMX), which is located on chromosome X. While all introns in the coding sequence have been processed out compared to the RBMX locus, the ORF is intact and there is specific evidence for transcription at this location. The preservation of the ORF by purifying selection in all Old World monkeys carrying it suggests that this locus is likely to be functional, possibly during male meiosis when X chromosomal genes are silenced or during haploid stages of spermatogenesis. This gene shares 5' exon structure with the cysteine conjugate-beta lyase 2 locus on chromosome 1, but the coding sequences are non-overlapping. Alternative splicing results in two transcript variants. [provided by RefSeq, Jun 2009]</p>
