| Alternative Name: | ORC2 (ORC2 Products) |
|-------------------|---|
| Background: | Optional[synonyms]: The origin recognition complex (ORC) is a highly conserved six subunits |
| | protein complex essential for the initiation of the DNA replication in eukaryotic cells. Studies in |
| | yeast demonstrated that ORC binds specifically to origins of replication and serves as a |
| | platform for the assembly of additional initiation factors such as Cdc6 and Mcm proteins. The |
| | protein encoded by this gene is a subunit of the ORC complex. This protein forms a core |
| | complex with ORC3, -4, and -5. It also interacts with CDC45 and MCM10, which are proteins |
| | known to be important for the initiation of DNA replication. This protein has been demonstrated |
| | to specifically associate with the origin of replication of Epstein-Barr virus in human cells, and is |
| | thought to be required for DNA replication from viral origin of replication. Alternatively spliced |
| | transcript variants have been found, one of which is a nonsense-mediated mRNA decay |
| | candidate. [provided by RefSeq, Oct 2010] |
