| | Background: Involved in transcriptional activation and repression of select genes by chromatir |
| | remodeling (alteration of DNA-nucleosome topology). May stimulate the ATPase activity of the |
| | catalytic subunit of the complex. Also involved in vitamin D-coupled transcription regulation via |
| | its association with the WINAC complex, a chromatin-remodeling complex recruited by vitamin |
| | D receptor (VDR), which is required for the ligand-bound VDR-mediated transrepression of the |
| | CYP27B1 gene. Belongs to the neural progenitors-specific chromatin remodeling complex |
| | (npBAF complex) and the neuron-specific chromatin remodeling complex (nBAF complex). |
| | During neural development a switch from a stem/progenitor to a post-mitotic chromatin |
| | remodeling mechanism occurs as neurons exit the cell cycle and become committed to their |
| | adult state. The transition from proliferating neural stem/progenitor cells to post-mitotic |
| | neurons requires a switch in subunit composition of the npBAF and nBAF complexes. As neuro |
| | progenitors exit mitosis and differentiate into neurons, npBAF complexes which contain |
| | ACTL6A/BAF53A and PHF10/BAF45A, are exchanged for homologous alternative |
| | ACTL6B/BAF53B and DPF1/BAF45B or DPF3/BAF45C subunits in neuron-specific complexes |
| | (nBAF). The npBAF complex is essential for the self-renewal/proliferative capacity of the |
| | multipotent neural stem cells. The nBAF complex along with CREST plays a role regulating the |
| | activity of genes essential for dendrite growth. |
