## Target Details

Background:	Slc35D1 Antibody: The solute carrier family Slc35 consists of at least 17 proteins that act as
	nucleotide sugar transporters localized to the Golgi apparatus and endoplasmic reticulum. The
	role of the ER-resident SIc family member SIc35D1 is to transport both UDP-glucuronic acid and
	UDP-N-acetylgalactosamine. These molecules can serve as substrates for chondroitin sulfate
	biosynthesis and mice lacking the Slc35D1 gene developed a lethal form of skeletal dysplasia
	with severe shortening of limbs and facial structures. Examination of epiphyseal cartilage in
	these mice revealed a decreased proliferating zone with round chrondrocytes, scarce matrices,
	and reduced proteoglycan aggregates. Loss of function mutations in human Slc35D1 cause
	Schneckenbecken dysplasia, a severe skeletal dysplasia.

Gene ID:	23169
