## Target Details

Background:	Inositol polyphosphate 4-phosphatase type II (INPP4B) is one of the enzymes involved in
	phosphatidylinositol signaling pathways. It removes the phosphate group at position 4 of the
	inositol ring from inositol 3,4-bisphosphate (1). INPP4B can function as a tumor suppressor by
	inhibiting PI3K signaling. In human epithelial cells, knockdown of INPP4B expression resulted in
	enhanced Akt activation, anchorage-independent growth, and enhanced overall motility (2). It is
	thought INPP4B may also have oncogenic functions as INPP4B-dependent PI3K signaling is
	mediated by SGK3 in breast cancer cells and expression of INPP4B leads to enhanced SGK3
	activation and suppression of AKT phosphorylation (3).
