	Background: SHIP1 is a member of the inositol polyphosphate-5-phosphatase (INPP5) family
	and contains an N-terminal SH2 domain, an inositol phosphatase domain, and two C-terminal
	protein interaction domains. Expression of this protein is restricted to hematopoietic cells
	where its movement from the cytosol to the plasma membrane is mediated by tyrosine
	phosphorylation in response to multiple cytokine and B and T cell receptor activation. At the
	plasma membrane, the protein hydrolyzes the 5' phosphate from phosphatidylinositol (3,4,5)-
	trisphosphate and inositol-1,3,4,5-tetrakisphosphate, thereby affecting multiple signaling
	pathways. Overall the protein functions as a negative regulator of myeliod cell proliferation and
	survival.
