	synaptic vesicle exocytosis by enhancing vesicle priming, fusion and dilation of exocytotic
	fusion pores. Mechanistically, acts by increasing local Ca2+ release from microdomains which
	is essential for the enhancement of ATP-induced exocytosis. Acts also as a molecular
	chaperone in its multimeric membrane-bound state, assisting in the folding of synaptic fusion
	components called SNAREs (Soluble NSF Attachment Protein REceptors) at presynaptic
	plasma membrane in conjunction with cysteine string protein-alpha/DNAJC5. This chaperone
	activity is important to sustain normal SNARE-complex assembly during aging. Plays also a role
	in the regulation of the dopamine neurotransmission by associating with the dopamine
	transporter (DAT1) and thereby modulating its activity.
