Alternative Name:	PKC gamma/SCA14 (PRKCG Products)
Background:	Synonyms: PKC gamma, PKCC, PKC, PKCG, PRKCG, Protein kinase C gamma, Protein kinase C gamma polypeptide, Protein kinase C gamma type, SCA 14, SCA14.
	Background: Protein kinase C (PKC) is a family of serine- and threonine-specific protein kinases
	that can be activated by calcium and second messenger diacylglycerol. PKC family members
	phosphorylate a wide variety of protein targets and are known to be involved in diverse cellular
	signaling pathways. PKC also serve as major receptors for phorbol esters, a class of tumor
	promoters. Each member of the PKC family has a specific expression profile and is believed to
	play distinct roles in cells. The protein encoded by this gene is one of the PKC family members.
	There have been at least 12 different PKC isoforms identified in humans to date including
	alpha, beta I, beta II, gamma, delta, epsilon, zeta, eta, theta, iota, lambda, and mu. PKC gamma
	is expressed solely in the brain and spinal cord and its localization is restricted to neurons. It
	has been demonstrated that several neuronal functions, including long term potentiation (LTP)
	and long term depression (LTD), specifically require this kinase. Knockout studies in mice also
	suggest that this kinase may be involved in neuropathic pain development. Defects in this
	protein have been associated with neurodegenerative disorder spinocerebellar ataxia-14
	(SCA14).

	gamma, Thromboxane A2 Receptor Signaling, VEGF Signaling
