Target Details				
Alternative Name:	OGG1 (OGG1 Products)			
Background:	Synonyms: 8 hydroxyguanine DNA glycosylase, 8 oxoguanine DNA glycosylase 1, 8-oxoguanine DNA glycosylase, AP lyase, DNA apurinic or apyrimidinic site lyase, DNA lyase, DNA-apurinic or apyrimidinic site lyase, HMMH, HOGG 1, HOGG1, MMH, MUTM, N-glycosylase, Ogg 1, OGH 1, OGH1, OGG1_HUMAN. Background: This gene encodes the enzyme responsible for the excision of 8-oxoguanine, a mutagenic base byproduct which occurs as a result of exposure to reactive oxygen. The action of this enzyme includes lyase activity for chain cleavage. Alternative splicing of the C-terminal region of this gene classifies splice variants into two major groups, type 1 and type 2, depending on the last exon of the sequence. Type 1 alternative splice variants end with exon 7 and type 2 end with exon 8. All variants share the N-terminal region in common, which contains a mitochondrial targeting signal that is essential for mitochondrial localization. Many alternative splice variants for this gene have been described, but the full-length nature for every variant has not been determined. [provided by RefSeq, Aug 2008].
