| | protein, Cholesteryl ester transfer protein plasma, Cholesteryl ester transfer protein precursor, | |
| | HDLCQ10, Lipid transfer protein I. | |
| | Background: High density lipoproteins (HDLs) have been proposed to function jointly with | |
| | lecithin:cholesterol acyltransferase and CETP to facilitate cholesterol transport from tissues to | |
| | the liver. This mechanism, referred to as reverse cholesterol transport, is physiologically | |
| | important because it maintains systemic cholesterol levels. CETP is responsible for neutral lipid | |
| | transfer activity in plasma in numerous species. Since CETP is able to accelerate specifically | |
| | the exchange of lipid components between pro- and anti-atherogenic lipoprotein fractions, it | |
| | may be a key determinant of the global atherogenicity of the plasma lipoprotein profile and | |
| | arises as a possible target in atherosclerosis prevention. CETP has an important role in reverse | |
| | cholesterol transport and shaping and affecting the composition of plasma lipoproteins. In | |
| | general elevated levels of CETP have been associated with increased risk of coronary heart | |
| | disease. | |
