Target Details	
Alternative Name:	CTCF (CTCF Products)
Background:	Synonyms: MRD21, Transcriptional repressor CTCF, 11-zinc finger protein, CCCTC-binding
	factor, CTCFL paralog, CTCF
	Background: Chromatin binding factor that binds to DNA sequence specific sites. Involved in
	transcriptional regulation by binding to chromatin insulators and preventing interaction betwee
	promoter and nearby enhancers and silencers. Acts as transcriptional repressor binding to
	promoters of vertebrate MYC gene and BAG1 gene. Also binds to the PLK and PIM1 promoters
	Acts as a transcriptional activator of APP. Regulates APOA1/C3/A4/A5 gene cluster and
	controls MHC class II gene expression. Plays an essential role in oocyte and preimplantation
	embryo development by activating or repressing transcription. Seems to act as tumor
	suppressor. Plays a critical role in the epigenetic regulation. Participates in the allele-specific
	gene expression at the imprinted IGF2/H19 gene locus. On the maternal allele, binding within
	the H19 imprinting control region (ICR) mediates maternally inherited higher-order chromatin
	conformation to restrict enhancer access to IGF2. Plays a critical role in gene silencing over
	considerable distances in the genome. Preferentially interacts with unmethylated DNA,
	preventing spreading of CpG methylation and maintaining methylation-free zones. Inversely,
	binding to target sites is prevented by CpG methylation. Plays a important role in chromatin
	remodeling. Can dimerize when it is bound to different DNA sequences, mediating long-range
	chromatin looping. Mediates interchromosomal association between IGF2/H19 and WSB1/NF
	and may direct distant DNA segments to a common transcription factory. Causes local loss of
	histone acetylation and gain of histone methylation in the beta-globin locus, without affecting
	transcription. When bound to chromatin, it provides an anchor point for nucleosomes
	positioning. Seems to be essential for homologous X-chromosome pairing. May participate
	with Tsix in establishing a regulatable epigenetic switch for X chromosome inactivation.
