	B4, UDP glucuronosyltransferase 2B4 precursor, UDP glucuronyltransferase family 2 beta 4,	
	UDP glycosyltransferase 2 family polypeptide B4, UDP glycosyltransferase, UDPGT, UDPGTh 1,	
	UDPGTh1, UGT2B11, UGT2B4, UD2B4_HUMAN.	
	Background: The UDP-Glucuronosyltransferases (UGT) comprise a family of enzymes that	
	detoxify and enhance the urinary excretion of a wide variety of xenobiotic and endogenous	
	substrates by transferring glucuronic acid to sulfhydryl, hydroxyl, aromatic amino, or carboxylic	
	acid groups. They have been subdivided into two families, UGT1 and UGT2, based on the	
	evolutionary divergence of their genes. The enzymes of the UGT1A family play an important	
	role in the metabolism of dietary constituents, phenols, and therapeutic drugs, and also the	
	glucuronidation of bilirubin and iodothyronines. The enzymes of the UGT2B family are involved	
	in the metabolism of bile acids, phenol derivatives, catecholestrogens and steroids. Although it	
	is widely recognized that the liver is the major site of glucuronidation, it is now clear that UGT	
	enzymes are also found in extra-hepatic tissues.
