Target Details	
Background:	Synonyms: Idd18.1, AA986410, A530094I06Rik, Guanine nucleotide exchange factor VAV3, VAV-3, Vav3
	Background: Exchange factor for GTP-binding proteins RhoA, RhoG and, to a lesser extent,
	Rac1. Binds physically to the nucleotide-free states of those GTPases (By similarity). Plays an
	important role in angiogenesis. Its recruitment by phosphorylated EPHA2 is critical for EFNA1-
	induced RAC1 GTPase activation and vascular endothelial cell migration and assembly. May be
	important for integrin-mediated signaling, at least in some cell types. In osteoclasts, along with
	SYK tyrosine kinase, required for signaling through integrin alpha-v/beta-1 (ITAGV-ITGB1), a
	crucial event for osteoclast proper cytoskeleton organization and function. This signaling
	pathway involves RAC1, but not RHO, activation. Necessary for proper wound healing. In the
	course of wound healing, required for the phagocytotic cup formation preceding macrophage
	phagocytosis of apoptotic neutrophils. Responsible for integrin beta-2-mediated macrophage
	adhesion and, to a lesser extent, contributes to beta-3-mediated adhesion. Does not affect
	integrin beta-1-mediated adhesion.
