|-------------------|---|
| Alternative Name: | Bub1 (BUB1 Products)  |
| Background:       | Synonyms: BUB1A, BUB1L, hBUB1, Mitotic checkpoint serine/threonine-protein kinase BUB1,<br>BUB1   |
|                   | Background: Serine/threonine-protein kinase that performs 2 crucial functions during mitosis: it  |
|                   | is essential for spindle-assembly checkpoint signaling and for correct chromosome alignment.      |
|                   | Has a key role in the assembly of checkpoint proteins at the kinetochore, being required for the  |
|                   | subsequent localization of CENPF, BUB1B, CENPE and MAD2L1. Required for the kinetochore           |
|                   | localization of PLK1. Plays an important role in defining SGOL1 localization and thereby affects  |
|                   | sister chromatid cohesion. Acts as a substrate for anaphase-promoting complex or cyclosome        |
|                   | (APC/C) in complex with its activator CDH1 (APC/C-Cdh1). Necessary for ensuring proper            |
|                   | chromosome segregation and binding to BUB3 is essential for this function. Can regulate           |
|                   | chromosome segregation in a kinetochore-independent manner. Can phosphorylate BUB3. The           |
|                   | BUB1-BUB3 complex plays a role in the inhibition of APC/C when spindle-assembly checkpoint        |
|                   | is activated and inhibits the ubiquitin ligase activity of APC/C by phosphorylating its activator |
|                   | CDC20. This complex can also phosphorylate MAD1L1. Kinase activity is essential for inhibition    |
|                   | of APC/CCDC20 and for chromosome alignment but does not play a major role in the spindle-         |
|                   | assembly checkpoint activity. Mediates cell death in response to chromosome missegregation        |
|                   | and acts to suppress spontaneous tumorigenesis.   |
| Gene ID:          | 699   |
