Target Details

Background:	<p>Synonyms: Paired immunoglobulin-like type 2 receptor beta, Activating receptor PILR beta, Cell surface receptor FDFACT, Cell surface receptor FDFACT1, Cell surface receptor FDFACT2, FDFACT, FDFACT1, FDFACT2, PILR_, Paired immunoglobulin like receptor beta, Paired immunoglobulin like type 2 receptor beta, Paired immunoglobulin like type 2 receptor beta precursor.</p> <p>Background: Control of cell signaling via SHP-1 is thought to occur through a balance between PILRalpha-mediated inhibition and PILRbeta-mediated activation. These paired immunoglobulin-like receptor genes are located in a tandem head-to-tail orientation on chromosome 7. PILRB is the non-ITIM-bearing member of the receptor pair, which has a truncated cytoplasmic tail relative to its ITIM-bearing partner and functions in the activating role. There are three named isoforms produced by alternative splicing.</p>
