	Background: Component of the THO subcomplex of the TREX complex. The TREX complex
	specifically associates with spliced mRNA and not with unspliced pre-mRNA. It is recruited to
	spliced mRNAs by a transcription-independent mechanism. Binds to mRNA upstream of the
	exon-junction complex (EJC) and is recruited in a splicing- and cap-dependent manner to a
	region near the 5' end of the mRNA where it functions in mRNA export. The recruitment occurs
	via an interaction between ALYREF/THOC4 and the cap-binding protein NCBP1. DDX39B
	functions as a bridge between ALYREF/THOC4 and the THO complex. The TREX complex is
	essential for the export of Kaposi's sarcoma-associated herpesvirus (KSHV) intronless mRNAs
	and infectious virus production. The recruitment of the TREX complex to the intronless viral
	mRNA occurs via an interaction between KSHV ORF57 protein and ALYREF/THOC4. Splice
	factor that is required for the first ATP-dependent step in spliceosome assembly and for the
	interaction of U2 snRNP with the branchpoint. Has both RNA-stimulated ATP
	binding/hydrolysis activity and ATP-dependent RNA unwinding activity. Even with the
	stimulation of RNA, the ATPase activity is weak. Can only hydrolyze ATP but not other NTPs.
	The RNA stimulation of ATPase activity does not have a strong preference for the sequence
	and length of the RNA. However, ssRNA stimulates the ATPase activity much more strongly
	than dsRNA. Can unwind 5' or 3' overhangs or blunt end RNA duplexes in vitro. The ATPase and
	helicase activities are not influenced by U2AF2 and ALYREF/THOC4.
