	that can bind interleukin 4 and interleukin 13 to regulate IgE production. The encoded protein
	also can bind interleukin 4 to promote differentiation of Th2 cells. A soluble form of the
	encoded protein can be produced by proteolysis of the membrane-bound protein, and this
	soluble form can inhibit IL4-mediated cell proliferation and IL5 upregulation by T-cells. Allelic
	variations in this gene have been associated with atopy, a condition that can manifest itself as
	allergic rhinitis, sinusitus, asthma, or eczema. Polymorphisms in this gene are also associated
	with resistance to human immunodeficiency virus type-1 infection. Alternate splicing results in
	multiple transcript variants.
Molecular Weight:	predicted molecular mass of 24.6 kDa after removal of the signal peptide. The apparent
	molecular mass of IL4RA-His is 35-55 kDa due to glycosylation.
