Background:	Synonyms: Background:The BBSome complex is thought to function as a coat complex required for sorting of specific membrane proteins to the primary cilia. The BBSome complex is required for ciliogenesis but is dispensable for centriolar satellite function. This ciliogenic function is mediated in part by the Rab8 GDP/GTP exchange factor, which localizes to the basal

	body and contacts the BBSome. Rab8(GTP) enters the primary cilium and promotes extension
	of the ciliary membrane. Firstly the BBSome associates with the ciliary membrane and binds to
	RAB3IP/Rabin8, the guanosyl exchange factor(GEF) for Rab8 and then the Rab8-GTP localizes
	to the cilium and promotes docking and fusion of carrier vesicles to the base of the ciliary
	membrane. The BBSome complex, together with the LTZL1, controls SMO ciliary trafficking and
	contributes to the sonic hedgehog(SHH) pathway regulation. Required for proper BBSome
	complex assembly and its ciliary localization. Required for microtubule anchoring at the
	centrosome but not for microtubule nucleation. May be required for the dynein-mediated
	transport of pericentriolar proteins to the centrosome.
