#### Target Details

Target:	BBS7
Alternative Name:	BBS7 (BBS7 Products)
Background:	Synonyms:BBS2L1 Background:The BBSome complex is thought to function as a coat complex required for sorting of specific membrane proteins to the primary cilia. The BBSome complex is required for ciliogenesis but is dispensable for centriolar satellite function. This ciliogenic
	function is mediated in part by the Rab8 GDP/GTP exchange factor, which localizes to the basal

body and contacts the BBSome. Rab8(GTP) enters the primary cilium and promotes extension
of the ciliary membrane. Firstly the BBSome associates with the ciliary membrane and binds to
RAB3IP/Rabin8, the guanosyl exchange factor(GEF) for Rab8 and then the Rab8-GTP localizes
to the cilium and promotes docking and fusion of carrier vesicles to the base of the ciliary
membrane. The BBSome complex, together with the LTZL1, controls SMO ciliary trafficking and
contributes to the sonic hedgehog(SHH) pathway regulation. Required for proper BBSome
complex assembly and its ciliary localization.
