| | Background: This gene encodes a protein that shares a high degree of sequence similarity with |
| | p21-activated kinase (PAK) family members. The proteins of this family are Rac/Cdc42- |
| | associated Ste20-like Ser/Thr protein kinases, characterized by a highly conserved amino- |
| | terminal Cdc42/Rac interactive binding (CRIB) domain and a carboxyl-terminal kinase domain. |
| | PAK kinases are implicated in the regulation of a number of cellular processes, including |
| | cytoskeleton rearrangement, apoptosis and the MAP kinase signaling pathway. The protein |
| | encoded by this gene was found to interact with androgen receptor (AR), which is a steroid |
| | hormone-dependent transcription factor that is important for male sexual differentiation and |
| | development. The p21-activated protein kinase 6 gene was found to be highly expressed in |
| | testis and prostate tissues and the encoded protein was shown to cotranslocate into the |
| | nucleus with AR in response to androgen. |
