	Background: The protein encoded by this gene is a member of the protein tyrosine phosphatas	
	(PTP) family. PTPs are known to be signaling molecules that regulate a variety of cellular	
	processes including cell growth, differentiation, mitotic cycle, and oncogenic transformation.	
	This gene is preferentially expressed in a variety of hematopoietic cells, and is an early	
	response gene in lymphokine stimulated cells. The non-catalytic N-terminus of this PTP can	
	interact with MAP kinases and suppress the MAP kinase activities. This PTP was shown to be	
	involved in the regulation of T cell antigen receptor (TCR) signaling, which was thought to	
	function through dephosphorylating the molecules related to MAP kinase pathway. Multiple	
	alternatively spliced transcript variants have been found for this gene. [provided by RefSeq].
