	processing by-products and non-coding 'pervasive' transcripts, such as antisense RNA species	
	and promoter-upstream transcripts(PROMPTs), and of mRNAs with processing defects,	
	thereby limiting or excluding their export to the cytoplasm. The RNA exosome may be involved	
	in Ig class switch recombination(CSR) and/or Ig variable region somatic hypermutation(SHM)	
	by targeting AICDA deamination activity to transcribed dsDNA substrates. In the cytoplasm, the	
	RNA exosome complex is involved in general mRNA turnover and specifically degrades	
	inherently unstable mRNAs containing AU-rich elements(AREs) within their 3' untranslated	
	regions, and in RNA surveillance pathways, preventing translation of aberrant mRNAs. It seems	
	to be involved in degradation of histone mRNA. The catalytic inactive RNA exosome core	
	complex of 9 subunits(Exo-9) is proposed to play a pivotal role in the binding and presentation	
	of RNA for ribonucleolysis, and to serve as a scaffold for the association with catalytic subunits	
	and accessory proteins or complexes. EXOSC2 as peripheral part of the Exo-9 complex	
	stabilizes the hexameric ring of RNase PH-domain subunits through contacts with EXOSC4 and	
	EXOSC7.
