	putative tumor suppressor 1, Psdzip70, LZTS1_HUMAN.
	Background: This gene encodes a tumor suppressor protein that is ubiquitously expressed in
	normal tissues. In uveal melanomas, expression of this protein is silenced in rapidly
	metastasizing and metastatic tumor cells but has normal expression in slowly metastasizing or
	nonmetastasizing tumor cells. This protein may have a role in cell-cycle control by interacting
	with the Cdk1/cyclinB1 complex. This gene is located on chromosomal region8p22. Loss of
	heterozygosity (LOH) in the 8p arm is a common characteristic of many types of cancer.
