	either as a monomer (monoubiquitin), a polymer linked via different Lys residues of the
	ubiquitin (polyubiquitin chains) or a linear polymer linked via the initiator Met of the ubiquitin
	(linear polyubiquitin chains). Polyubiquitin chains, when attached to a target protein, have
	different functions depending on the Lys residue of the ubiquitin that is linked: Lys-6-linked may
	be involved in DNA repair, Lys-11-linked is involved in ERAD (endoplasmic reticulum-associated
	degradation) and in cell-cycle regulation, Lys-29-linked is involved in lysosomal degradation,
	Lys-33-linked is involved in kinase modification, Lys-48-linked is involved in protein degradation
	via the proteasome, Lys-63-linked is involved in endocytosis, DNA-damage responses as well as
	in signaling processes leading to activation of the transcription factor NF-kappa-B. Linear
	polymer chains formed via attachment by the initiator Met lead to cell signaling. Ubiquitin is
	usually conjugated to Lys residues of target proteins, however, in rare cases, conjugation to Cys
	or Ser residues has been observed. When polyubiquitin is free (unanchored-polyubiquitin), it
	also has distinct roles, such as in activation of protein kinases, and in signaling.
