	molybdenum cofactor. Acts by mediating the C-terminal thiocarboxylation of sulfur carriers
	URM1 and MOCS2A. Its N-terminus first activates URM1 and MOCS2A as acyl-adenylates (-
	COAMP), then the persulfide sulfur on the catalytic cysteine is transferred to URM1 and
	MOCS2A to form thiocarboxylation (-COSH) of their C-terminus. The reaction probably involves
	hydrogen sulfide that is generated from the persulfide intermediate and that acts as nucleophile
	towards URM1 and MOCS2A. Subsequently, a transient disulfide bond is formed. Does not use
	thiosulfate as sulfur donor, NFS1 probably acting as a sulfur donor for thiocarboxylation
	reactions.
