	repeats added by telomerase and protects chromosome ends. Without its protective activity,
	telomeres are no longer hidden from the DNA damage surveillance and chromosome ends are
	inappropriately processed by DNA repair pathways. Promotes binding of POT1 to single-
	stranded telomeric DNA. Modulates the inhibitory effects of POT1 on telomere elongation. The
	ACD-POT1 heterodimer enhances telomere elongation by recruiting telomerase to telomeres
	and increasing its processivity. May play a role in organogenesis.
