	this activity may be independent of acetylation activity. Acetylates alpha-tubulin with a slow
	enzymatic rate, due to a catalytic site that is not optimized for acetyl transfer. Enters the
	microtubule through each end and diffuses quickly throughout the lumen of microtubules.
	Acetylates only long/old microtubules because of its slow acetylation rate since it does not
	have time to act on dynamically unstable microtubules before the enzyme is released. Required
	for normal sperm flagellar function. Promotes directional cell locomotion and chemotaxis,
	through AP2A2-dependent acetylation of alpha-tubulin at clathrin-coated pits that are
	concentrated at the leading edge of migrating cells. May facilitate primary cilium assembly.
