	ciliogenesis but is dispensable for centriolar satellite function. This ciliogenic function is
	mediated in part by the Rab8 GDP/GTP exchange factor, which localizes to the basal body and
	contacts the BBSome. Rab8(GTP) enters the primary cilium and promotes extension of the
	ciliary membrane. Firstly the BBSome associates with the ciliary membrane and binds to
	RAB3IP/Rabin8, the guanosyl exchange factor (GEF) for Rab8 and then the Rab8-GTP localizes
	to the cilium and promotes docking and fusion of carrier vesicles to the base of the ciliary
	membrane. The BBSome complex, together with the LTZL1, controls SMO ciliary trafficking and
	contributes to the sonic hedgehog (SHH) pathway regulation. Required for BBSome complex
	ciliary localization but not for the proper complex assembly.
