	biosynthetic protein transport from the ER, via the Golgi up to the trans Golgi network.
	Coatomer complex is required for budding from Golgi membranes, and is essential for the
	retrograde Golgi-to-ER transport of dilysine-tagged proteins. In mammals, the coatomer can
	only be recruited by membranes associated to ADP-ribosylation factors (ARFs), which are small
	GTP-binding proteins, the complex also influences the Golgi structural integrity, as well as the
	processing, activity, and endocytic recycling of LDL receptors. Plays a functional role in
	facilitating the transport of kappa-type opioid receptor mRNAs into axons and enhances
	translation of these proteins. Required for limiting lipid storage in lipid droplets. Involved in lipid
	homeostasis by regulating the presence of perilipin family members PLIN2 and PLIN3 at the
	lipid droplet surface and promoting the association of adipocyte surface triglyceride lipase
	(PNPLA2) with the lipid droplet to mediate lipolysis (By similarity). Involved in the Golgi
	disassembly and reassembly processes during cell cycle. Involved in autophagy by playing a
	role in early endosome function. Plays a role in organellar compartmentalization of secretory
	compartments including endoplasmic reticulum (ER)-Golgi intermediate compartment (ERGIC),
	Golgi, trans-Golgi network (TGN) and recycling endosomes, and in biosynthetic transport of
	CAV1. Promotes degradation of Nef cellular targets CD4 and MHC class I antigens by
	facilitating their trafficking to degradative compartments.
