contribute to catalysis through positioning of the substrate and the ubiquitin-conjugating
enzyme. The E3 ubiquitin-protein ligase activity of the complex is dependent on the neddylation
of the cullin subunit and is inhibited by the association of the deneddylated cullin subunit with
TIP120A/CAND1. The functional specificity of the E3 ubiquitin-protein ligase complex depends
on the variable substrate recognition component. DCX(DET1-COP1) directs ubiquitination of
JUN. DCX(DDB2) directs ubiquitination of XPC. DCX(DDB2) ubiquitinates histones H3-H4 and is
required for efficient histone deposition during replication-coupled (H3.1) and replication-
independent (H3.3) nucleosome assembly, probably by facilitating the transfer of H3 from
ASF1A/ASF1B to other chaperones involved in histone deposition. DCX(DTL) plays a role in
PCNA-dependent polyubiquitination of CDT1 and MDM2-dependent ubiquitination of TP53 in
response to radiation-induced DNA damage and during DNA replication. In association with
DDB1 and SKP2 probably is involved in ubiquitination of CDKN1B/p27kip. Is involved in
ubiquitination of HOXA9. DCX(DTL) directs autoubiquitination of DTL.
