	oxidizes a variety of structurally unrelated compounds, including steroids, fatty acids, retinoid
	and xenobiotics. Preferentially oxidizes 17beta-estradiol to the carcinogenic 4-hydroxy
	derivative, and a variety of procarcinogenic compounds to their activated forms, including
	polycyclic aromatic hydrocarbons. Promotes angiogenesis by removing cellular oxygenation
	products, thereby decreasing oxidative stress, release of antiangiogenic factor THBS2, then
	allowing endothelial cells migration, cell adhesion and capillary morphogenesis. These changes
	are concommitant with the endothelial nitric oxide synthase activity and nitric oxide synthesis.
	Plays an important role in the regulation of perivascular cell proliferation, migration, and survival
	through modulation of the intracellular oxidative state and NF-kappa-B expression and/or
	activity, during angiogenesis. Contributes to oxidative homeostasis and ultrastructural
	organization and function of trabecular meshwork tissue through modulation of POSTN
	expression.
