	proteins that regulate dynein function. Cytoplasmic dynein 1 acts as a motor for the
	intracellular retrograde motility of vesicles and organelles along microtubules. May play a role in
	binding dynein to membranous organelles or chromosomes. Probably involved in the
	microtubule-dependent transport of pericentrin. Is required for progress through the spindle
	assembly checkpoint. The phosphorylated form appears to be involved in the selective removal
	of MAD1L1 and MAD1L2 but not BUB1B from kinetochores.
