	through interaction with DSH (Dishevelled) family proteins. The activation/inhibition of Wnt
	signaling may depend on the phosphorylation status. Proposed to regulate the degradation of
	CTNNB1/beta-catenin, thereby modulating the transcriptional activation of target genes of the
	Wnt signaling pathway. Its function in stabilizing CTNNB1 may involve inhibition of GSK3B
	activity. Promotes the membrane localization of CTNNB1. The cytoplasmic form can induce
	DVL2 degradation via a lysosome-dependent mechanism, the function is inhibited by PKA-
	induced binding to 14-3-3 proteins, such as YWHAB. Seems to be involved in morphogenesis at
	the primitive streak by regulating VANGL2 and DVL2, the function seems to be independent of
	canonical Wnt signaling and rather involves the non-canonical Wnt/planar cell polarity (PCP)
	pathway (By similarity). The nuclear form may prevent the formation of LEF1:CTNNB1 complex
	and recruit HDAC1 to LEF1 at target gene promoters to repress transcription thus antagonizing
	Wnt signaling. May be involved in positive regulation of fat cell differentiation. During neuronal
	differentiation may be involved in excitatory synapse organization, and dendrite formation and
	establishment of spines.
