	transcription of these genes. Binds to the retinoic acid response element (RARE) 5\\\'-
	AGGGTTCACCGAAAGTTCA-3\\\'. Activates the proenkephalin gene independently of promoter
	binding, probably through protein-protein interaction. When secreted, behaves as an inhibitor of
	cell proliferation, by arresting cells in the G0 or G1 phase. Required for neural tube closure and
	skeletal patterning. Regulates epithelial cell proliferation and side-branching in the mammary
	gland. Controls the expression of peripheral tissue antigens in pancreatic lymph nodes. Isoform
	1 displays greater transcriptional activity than isoform 4. Isoform 4 may inhibit transcriptional
	activity of isoform 1 by interacting with isoform 1 and retaining it in the cytoplasm.
	Transcriptional activator of EIF4G3.
