	gametogenesis. The MCM8-MCM9 complex probably acts as a hexameric helicase
	downstream of the Fanconi anemia proteins BRCA2 and RAD51 and is required to process
	aberrant forks into homologous recombination substrates and to orchestrate homologous
	recombination with resection, fork stabilization and fork restart. May also play a non-essential
	for DNA replication: may be involved in the activation of the prereplicative complex (pre-RC)
	during G(1) phase by recruiting CDC6 to the origin recognition complex (ORC). Binds chromatin
	throughout the cell cycle.
