Target Details

Target:	TOP1MT
Alternative Name:	TOP1MT (TOP1MT Products)
Background:	Background: Releases the supercoiling and torsional tension of DNA introduced during
	duplication of mitochondrial DNA by transiently cleaving and rejoining one strand of the DNA

Target Details

duplex. Introduces a single-strand break via transesterification at a target site in duplex DNA. The scissile phosphodiester is attacked by the catalytic tyrosine of the enzyme, resulting in the formation of a DNA-(3\'-phosphotyrosyl)-enzyme intermediate and the expulsion of a 5\'-OH DNA strand. The free DNA strand then rotates around the intact phosphodiester bond on the opposing strand, thus removing DNA supercoils. Finally, in the religation step, the DNA 5\'-OH attacks the covalent intermediate to expel the active-site tyrosine and restore the DNA phosphodiester backbone (By similarity).
