	which synthesizes mRNA precursors and many functional non-coding RNAs. Pol II is the central
	component of the basal RNA polymerase II transcription machinery. It is composed of mobile
	elements that move relative to each other. RPB7 is part of a subcomplex with RPB4 that binds
	to a pocket formed by RPB1, RPB2 and RPB6 at the base of the clamp element. The RBP4-
	RPB7 subcomplex seems to lock the clamp via RPB7 in the closed conformation thus
	preventing double-stranded DNA to enter the active site cleft. The RPB4-RPB7 subcomplex
	binds single-stranded DNA and RNA (By similarity). Binds RNA.
