| | that recognizes target proteins in a broad and relatively non-specific manner. Catalyzes |
| | ISGylation of IRF3 which results in sustained activation, it attenuates IRF3-PIN1 interaction, |
| | which antagonizes IRF3 ubiquitination and degradation, and boosts the antiviral response. |
| | Catalyzes ISGylation of influenza A viral NS1 which attenuates virulence, ISGylated NS1 fails to |
| | form homodimers and thus to interact with its RNA targets. Catalyzes ISGylation of |
| | papillomavirus type 16 L1 protein which results in dominant-negative effect on virus infectivity. |
| | Physically associated with polyribosomes, broadly modifies newly synthesized proteins in a |
| | cotranslational manner. In an interferon-stimulated cell, newly translated viral proteins are |
| | primary targets of ISG15. Aliases: CEB1 antibody, CEBP1 antibody, Cyclin E binding protein 1 antibody, Cyclin-E-binding |
