cells. The signaling pathway downstream of the receptor is referred to as forward signaling
while the signaling pathway downstream of the ephrin ligand is referred to as reverse signaling.
Highly promiscuous, it has the unique property among Eph receptors to bind and to be
physiologically activated by both GPI-anchored ephrin-A and transmembrane ephrin-B ligands
including EFNA1 and EFNB3. Upon activation by ephrin ligands, modulates cell morphology and
integrin-dependent cell adhesion through regulation of the Rac, Rap and Rho GTPases activity.
Plays an important role in the development of the nervous system controlling different steps of
axonal guidance including the establishment of the corticospinal projections. May also control
the segregation of motor and sensory axons during neuromuscular circuit development. In
addition to its role in axonal guidance plays a role in synaptic plasticity. Activated by EFNA1
phosphorylates CDK5 at \'Tyr-15\' which in turn phosphorylates NGEF regulating RHOA and
dendritic spine morphogenesis. In the nervous system, plays also a role in repair after injury
preventing axonal regeneration and in angiogenesis playing a role in central nervous system
vascular formation. Additionally, its promiscuity makes it available to participate in a variety of
cell-cell signaling regulating for instance the development of the thymic epithelium.
