	components of blood clots. In addition, functions during the early stages of wound repair to
	stabilize the lesion and guide cell migration during re-epithelialization. Was originally thought to
	be essential for platelet aggregation, based on in vitro studies using anticoagulated blood.
	However, subsequent studies have shown that it is not absolutely required for thrombus
	formation in vivo. Enhances expression of SELP in activated platelets via an ITGB3-dependent
	pathway. Maternal fibrinogen is essential for successful pregnancy. Fibrin deposition is also
	associated with infection, where it protects against IFNG-mediated hemorrhage. May also
	facilitate the antibacterial immune response via both innate and T-cell mediated pathways.

	gamma polypeptide antibody, fibrinogen gamma-b chain antibody
