	ribosome-sized signalosomes. The beta-catenin canonical signaling pathway leads to the
	activation of disheveled proteins, inhibition of GSK-3 kinase, nuclear accumulation of beta-
	catenin and activation of Wnt target genes. A second signaling pathway involving PKC and
	calcium fluxes has been seen for some family members, but it is not yet clear if it represents a
	distinct pathway or if it can be integrated in the canonical pathway, as PKC seems to be
	required for Wnt-mediated inactivation of GSK-3 kinase. Both pathways seem to involve
	interactions with G-proteins. May be involved in transduction and intercellular transmission of
	polarity information during tissue morphogenesis and/or in differentiated tissues. Coreceptor
	along with RYK of Wnt proteins, such as WNT1.
