	histone protein involved in transcription, chromatin remodeling and V(D)J recombination and
	probably other processes. Binds DNA with a preference to non-canonical DNA structures such
	as single-stranded DNA. Can bent DNA and enhance DNA flexibility by looping thus providing a
	mechanism to promote activities on various gene promoters by enhancing transcription factor
	binding and/or bringing distant regulatory sequences into close proximity (PubMed:7797075,
	PubMed:11909973, PubMed:19522541, PubMed:18413230, PubMed:19965638,
	PubMed:20123072). Involved in V(D)J recombination by acting as a cofactor of the RAG
	complex: acts by stimulating cleavage and RAG protein binding at the 23 bp spacer of
	conserved recombination signal sequences (RSS) (By similarity). Proposed to be involved in the
	innate immune response to nucleic acids by acting as a promiscuous immunogenic DNA/RNA
	sensor which cooperates with subsequent discriminative sensing by specific pattern
	recognition receptors (By similarity). In the extracellular compartment acts as a chemokine.
	Promotes proliferation and migration of endothelial cells implicating AGER/RAGE
	(PubMed:19811285). Has antimicrobial activity in gastrointestinal epithelial tissues
	(PubMed:23877675). Involved in inflammatory response to antigenic stimulus coupled with
	proinflammatory activity (By similarity). Involved in modulation of neurogenesis probably by
	regulation of neural stem proliferation (By similarity). Involved in articular cartilage surface
	maintenance implicating LEF1 and the Wnt/beta-catenin pathway (By similarity).
