	where it is coexpressed with IgM. The membrane-bound IgD (mIgD) induces the
	phosphorylation of CD79A and CD79B by the Src family of protein tyrosine kinases. Soluble IgI
	(sIgD) concentration in serum below those of IgG, IgA, and IgM but much higher than that of
	IgE. IgM and IgD molecules present on B cells have identical V regions and antigen-binding
	sites. After the antigen binds to the B-cell receptor, the secreted form sIgD is shut off. IgD is a
	potent inducer of TNF, IL1B, and IL1RN. IgD also induces release of IL6, IL10, and LIF from
	peripheral blood mononuclear cells. Monocytes seem to be the main producers of cytokines in
	vitro in the presence of IgD.
