	metabolic process, which mediates the repression of transposable elements during meiosis by
	forming complexes composed of piRNAs and Piwi proteins and govern the methylation and
	subsequent repression of transposons. Acts as a co-chaperone via its interaction with HSP90
	and is required for the piRNA amplification process, the secondary piRNA biogenesis. May be
	required together with HSP90 in removal of 16 nucleotide ping-pong by-products from Piwi
	complexes, possibly facilitating turnover of Piwi complexes.
