	response via its interaction with p300/EP300. Increases p53/TP53-dependent transcription and
	apoptosis, suggesting an important role in p53/TP53 stress response such as DNA damage. In
	cytoplasm, acts as a nucleation-promoting factor for both branched and unbranched actin
	filaments. Activates the Arp2/3 complex to induce branched actin filament networks. Also
	catalyzes actin polymerization in the absence of Arp2/3, creating unbranched filaments.
	Contributes to cell motility by controlling actin dynamics. May promote the rapid formation of a
	branched actin network by first nucleating new mother filaments and then activating Arp2/3 to
	branch off these filaments. The p53/TP53-cofactor and actin activator activities are regulated
	via its subcellular location (By similarity).
