	IQWD1v MSTP055, Nuclear receptor interaction protein, RP4 745I14.1, DCAF6_HUMAN.
	Background: WD-repeat proteins are a large family of eukaryotic proteins coordinating multi-
	protein complex assemblies. Their role has been implicated in multiple cellular processes
	including signal transduction, transcriptional regulation, cell cycle control and apoptosis. NRIP
	is a novel 860a.a nuclear protein consisting of seven conserved WD40 domains and one NLS
	motif. It binds to androgen and glucocorticoid receptors and up-regulates their transcriptional
	activity, thereby functioning as a nuclear receptor co-activator. Role of NRIP has been
	implicated in cell growth and also in cervical and prostrate cancer, thus indicating a potential
	therapeutic intervention. Northern Blot analysis detects a high expression of NRIP in skeletal
	muscle and testis and low expression in heart, prostrate and adrenal gland.
