Target Details

Target:	NAT8	
Alternative Name:	NAT8 (NAT8 Products)	
Background:	Background: Acetylates the free alpha-amino group of cysteine S-conjugates to form	
	mercapturic acids (PubMed:20392701). This is the final step in a major route for detoxification	

of a wide variety of reactive electrophiles which starts with their incorporation into glutathione S-conjugates. The glutathione S-conjugates are then further processed into cysteine S-conjugates and finally mercapturic acids which are water soluble and can be readily excreted in urine or bile. Alternatively, may have a lysine N-acetyltransferase activity catalyzing peptidyllysine N6-acetylation of various proteins. Thereby, may regulate apoptosis through the acetylation and the regulation of the expression of PROM1 (PubMed:24556617). May also regulate amyloid beta-peptide secretion through acetylation of BACE1 and the regulation of its expression in neurons (PubMed:19011241).
